Some of the more technically used subjects, such as the removal of objects from a picture, may take some effort. Some attempts can look a bit strange despite plausible cleanliness tasks. One of the most useful new features is the blackboxing of objects, thereby removing them from the frame of your photo. For example, you can highlight a portion of the photo with a spot with soft edges, such as an animal. You can then blackbox the entire animal leaving only a white border. When you apply the Spot Removal tool, it creates the outline of your chosen spot, and then uses this outline for removing parts of the photo. It is a great tool for some advanced image cleanup to remove an object like a tree limb. In most cases, it works extremely well. However, since this requires a spot with soft edges, there can be some confusion if you don't use a small brush with soft edges set to a high opacity, such as 50%. I have a problem figuring out when the software shifts from blackboxing to removing parts of the photograph. A new "grunge adjustment layer" provides Photoshop users with a tool to "tone and tease" images on their own to create different looks. This is available as an optional tool in Blend & Sketch mode, but is also available in a new "Create a Grunge Layer" panel. This means that any image can be quickly 'grunged' using standard Photoshop tools. "The Grunge Layer will be automatically generated, and we have added some new features that give your 'grunge' layer a more dynamic edge, or a less torn edge. You can invoke the grunge tool directly, or layer styles, of course, give you more options for tweaking."

The Adobe Fireworks file format is used in the Adobe Fireworks, which is a vector-based diagram program (also known as a vector drawing application or vector editor). It does not actually save your diagrams as straight lines or shapes, but instead as an elaborate system of text, paths, glyphs, and other creative elements. Photoshop can read and modify these files.
