In terms of features, Lightroom 5 offers three major improvements, and it's here that the relaunch has been most successful. You can now choose a Styles panel to create your own custom effects, you can adjust sliders in each of the preview and raw modes to create special blends, and you can now use the Keyword (Kukeyword) functionalities in any editing mode or sorting order. Lightroom 5 also sports a more intelligent thumbnail-generation process, and you can now reduce the size of your images by up to 50%. The changes to the three major changes in Lightroom 5 do, however, come with some issues. For one, the Styles panels now offer in-depth, sophisticated features that leave you with the impression that you're not doing any computing at all. Such features, though, are quite limited, with tools to select, resize, and align objects (including text), create custom shape tools, and even insert objects from your camera card. While some of these features offer a wide range of editing options, these simply don't compare to the abilities of the editor's built-in content-aware resizing feature. Another issue is Lightroom's sliders for color correction: it was a time-consuming process to adjust sliders in each of the preview modes, and many times it wasn't a straight-forward task. Still, the slider parameters are far superior in terms of the amount of settings offered. Furthermore, you can now switch the active tab on the editor's interface by using a simple keystrokes: pressing R to select all, and S to select the other tabs. This can come in very handy for site designers and webmasters.

You'll see objects appear highlighted by blue lines and most often you'll find vector shapes like squares, circles, and triangles. To select the object you want, simply click and drag the line around the shape to select it and to cut it. The path you select will be represented by a blue line around all the shapes inside the image. Also, if you select multiple overlapping shapes, a number will appear next to the path, which is how many shapes you have selected. To change the color of an entire area of the image, you will need to click on the color you'd like to use and then click on the little square button that appears in the bottom right corner of the image to make the color tool active. Then simply click on the color that you want to use to select it and press and hold the left-click button on your mouse and drag the selection you need to change. If you'd like to use a gradient to change the color of an area of your image, click and drag along the edge of the concept you'd like to apply to the image, from the bottom left to the top right corner. A gradient is comprised of different colors that is made up by a series of steps, which you can preview before committing. To create a gradient, apply color to the left of the gradient with one of the color buttons until the gradient is exactly the color you want. If you need to select a color quickly, click on the swatch button provided on the color box toolbar. It will populate with all the hues of the color you've selected. You can then select a different color by clicking on it. 933d7f57e6
