Hypersensitivity pneumonitis in a farmer exposed to raw almonds. A case of hypersensitivity pneumonitis from raw almond exposure is reported. A 43-year-old man working in the almond orchards of California presented with a history of dyspnea, a 2-year history of a chronic cough, and an abnormal chest radiograph during heavy exercise. A roentgenogram showed severe diffuse interstitial changes. Pulmonary function tests were suggestive of restrictive ventilatory defects. Bronchoalveolar lavage showed lymphocytosis, an increased alveolar macrophage population, and an elevated total cell count. The histopathologic appearance of the lung showed diffuse alveolar damage. A subsequent skin test was positive to almonds. He was subsequently asked to wear an N-95 face mask in his almond orchard and was exposed to raw almonds for 6 weeks. After the cessation of exposure, symptoms did not recur. This case suggests that although raw almonds can cause respiratory symptoms in hypersensitive patients, they rarely cause diffuse lung disease.The Democratic 2020 presidential field has been crowded with women, including some of the most progressive women in American politics.
