Evaluation of a novel adjuvant poloxamer for a granulocyte-macrophage colony-stimulating factor-expressing vaccine against *Schistosoma japonicum* in mice. Granulocyte-macrophage colony-stimulating factor (GM-CSF) is a potent growth factor for the granulocyte lineage. In the present study, the biological effects of the GM-CSF gene on the host were evaluated. The co-administration of the GM-CSF gene and the gene for *Schistosoma japonicum* glutathione S-transferase-6 (SjGST-6) conferred a high degree of protection in mice immunized with SjGST-6. However, the protection level was significantly lower in mice receiving co-administration of GM-CSF and SjGST-6 than in those receiving the SjGST-6 alone, which resulted in more granuloma formation in the liver. This was possibly due to a much higher level of serum TNF- α in mice receiving co-administration of GM-CSF and SjGST-6 than in those receiving SjGST-6 alone. Moreover, a relatively lower expression level of IL-6 and higher levels of IL-2 and IFN- γ in the sera were observed in mice receiving the co-administration of GM-CSF and SjGST-6 than in those receiving the SjGST-6 alone. These findings indicated that the co-administration of GM-CSF could affect the host immune response when used
