Demo version of Celemony Melodyne Studio . Infos about Music Software Search Share your opinion For questions or suggestions about the site or if you found any bugs please Let us know. Your e-mail is never shared. Required fields are marked*CommentName*The present invention relates generally to an output controlling method and apparatus of a three-phase AC motor having a permanent magnet rotor and a current detecting apparatus employing pulse-width modulation (PWM) and variable switching frequency PWM (VFSF-PWM).

FIG. 1A shows a conventional output controlling apparatus of a three-phase AC motor. The apparatus comprises a three-phase AC motor 1 having a rotor 2 of a permanent magnet and a stator 3 of an armature, a current detecting circuit 4 for detecting a three-phase AC current in the three-phase AC motor, and a frequency setting unit 5 for setting the switching frequency of pulse-width modulated (PWM) controlled three-phase AC voltages at the three-phase AC motor 1 so as to control the current of the three-phase AC motor 1. In the frequency setting unit 5, a frequency setting table 6 is constructed so that the interval of one cycle of the input three-phase AC voltage is divided into twenty-one steps of 0.2 to 20 Hz. The current detecting circuit 4 is designed to operate in two periods, which are in the second and fourth periods of one cycle of the input three-phase AC voltage, respectively. When the current detecting circuit 4 operates in the second period, the PWM controlled voltage is determined according to the voltage of the three-phase AC motor 1 detected at that time. When the current detecting circuit 4 operates in the fourth period, the PWM controlled voltage is determined according to the voltage of the three-phase AC motor 1 detected at that time. The output controlling apparatus operates as follows. The current of the three-phase AC motor 1 is detected by the current detecting circuit 4, the PWM controlled voltage at each phase is determined according to the output of

the current detecting circuit 4, and the phase voltage of the three-phase AC motor 1 is input to the three-phase AC motor 1 in the PWM controlled voltage. The output of the three-phase AC motor 1 is detected by the current detecting circuit 4 in the second and fourth periods of the one cycle of the input three-phase AC voltage and the detected output is stored in
