Download Free Game Pak.The present invention relates to digital signal processing. In particular the invention relates to a digital signal processor suitable for processing digital audio signals. In general digital signal processors are suitable for processing a wide range of digital signals, including audio and other types. In some applications the digital signal processor may have a clock rate of above 200 MHz. Examples of applications include, for example, loud speaker synthesis, such as high-quality loud speaker systems, audio compression, high quality PCM audio recording systems and the like. One type of digital signal processor is referred to as a DSP. Most DSPs have a fixed architecture and, consequently, are designed for specific applications. This means that a DSP may not be capable of optimizing for a wide range of applications. DSPs have also been custom designed for a particular application. This requires a long development period due to a large degree of cost on both a per unit and non-unit cost. As the complexity of the different processing requirements increases, the coding overhead of the various applications also increases. This can reduce the number of bits available for actual data and thereby reduce the performance in terms of processing speed and efficiency. It is an object of the present invention to provide a digital signal processor which is suitable for a range of different applications. According to the present invention there is provided a digital signal processor comprising a decoding circuit comprising a user register to which a digital signal is input and the content of the register is encoded and a decoder to decode the encoded content, a parallel and/or serial data processor to perform processing on one or both of a digital and an analog signal and an input controller to control input of the digital signal to the decoding circuit. The decoding circuit may
