In this situation, it is a good idea to have a series of tools at your disposal. One of them is Pcrypt. There are two distinct versions: Pcrypt Live Pcrypt Live works completely from RAM, and is really convenient when you need to wipe a drive that you don't have plugged in. It is the same interface as Pcrypt, but is always running in RAM. And, while in use, it completely suspends all other programs and updates. The performance is quite good compared to other tools of this class. You can use it to wipe drives, images, partitions, and individual files, and while it is good at

making a fast job of the work, the real purpose is that it works from RAM, i.e. even if the USB drives in question lose power, the contents are never modified. Pcrypt Pcrypt works the same as Pcrypt Live, but starts, and leaves a record on the drive. You can then use this record to wipe the drive at a

Q: How many CPUs can a VM run on? The answer for this question said there can be up to 16 CPUs, and that they are numbered starting at 1. However, I ran into an obscure error. I have a VM with 4 CPUs and 2 GB of ram. When I select anything over 16 GB of ram, I get the following error: The amount of memory requested is more than the maximum supported by the system. Your request could not be completed due to insufficient memory. Despite this error, the maximum amount of memory used by that VM is 20 GB. I am able to switch to a different VM that has more RAM, so I don't believe the RAM is the problem. Is there a restriction

---

on how many CPUs a VM can have, or is the total amount of memory being used being the real problem? A: I figured out a solution to my own problem. I had a VM installed on a physical machine with 2 CPUs and 1 GB of RAM. I started the VM, and it had 4 CPUs and 1 GB of memory. I thought that maybe it was a bug, and I restarted the physical machine. The error occurred again, but this time it told me that my requested amount of memory was too much. When I changed the physical machine to a different one, it worked perfectly. The amount of memory used was the problem here. However, I will be cautious in the future to find out if a specific VM would work on a specific physical machine.
