The Exploit Test Tool Product Key simulates a variety of attacks against commonly-used Windows applications, including Internet Explorer 11, Microsoft Word 2013, Calculator, Access 2007, Adobe Reader, Microsoft PowerPoint 2013, Outlook 2013, and Adobe Acrobat. It displays a summary of the attack results in the description window, as well as the associated metadata. You can configure which applications to test, in addition to the exploit simulation parameters. Advanced Settings: Hide window: The window title bar remains visible during the simulation. To ensure that the window is completely hidden, set the Hide field on the Advanced Tab to Hide while the window is open. Multithreaded: Specifies whether the tool works with multiple threads (True) or a single thread (False). Language: The Exploit Test Tool can work with different languages, for example, the English versions of your anti-exploit software. To choose a particular language, select the language from the drop-down list on the toolbar. To revert to the previous setting, click the Clear All button. Item ID: Optional parameters for the specific application type Multiple tool windows are available when working with the Exploit Test Tool. For each section where the attributes can be configured, a set of various parameters can be customized. This includes the ID of the process that must be launched, the timeout interval, the environment variables used, the [M] and [b] flags, and the thread affinity. Example: To select a particular application from the drop-down list on the toolbar, click the Clear All button and start configuring tool windows. Windows Calculator Clicking the button Load will start the calculator attack simulation. The tool will then put Calculator to a test by repeatedly executing a malicious.plf file. As you can see in the overview, the number of attacks launched and the number of bytes transferred are displayed. The Reader Protection analysis window shows how the file activation process is triggered. In this particular case, the malicious.plf file is located in the system directory, but it could be located anywhere. The key to protecting an application is to identify malicious code when it is brought in as a document. Despite the fact that in this example the document is a.pdf file, it could be a.doc,.xls, or any other application file. As you can see in the image below, the Attack tab controls the attributes of the simulation. The Security Settings window provides the essentials to start the simulation.

Win32 analysis to detect available exploit attacks Exploitation testing using OllyDbg, which is commonly used for dumping Win32 binaries. Deploy IAT filtering and non-injectable payload WinDbg's PE file editor. It allows you to modify the imports table of any PE file. No need to decompile or disassemble the file to modify the imports table, making Exploit Test Tool another tool to test IAT filtering. Warnings: Exploit Test Tool depends on Win32 tools, most of which can be easily found in the Microsoft Windows SDK and the Windows 2003 Technical Preview SDK. The exploitation tests may take long to complete due to the OllyDbg process, especially if it runs an exploit simulation. A single run of a single test can take up to 30 minutes, which is far from ideal for a test tool. However, Exploit Test Tool has been designed to be easily customized to any application to detect specific attacks, and it can also be used to investigate the impact of unknown attacks. Exploit Test Tool Download: A: I think a lot of people are confused by this setup/release because they don't understand its purpose. Exploit Test Tool is a product developed by Virus Total, Inc. to provide security testing services, for Windows developers, penetration testers, malware analysts and security professionals to perform a fast, easy and safe way to test their Windows applications and operating systems for potential issues and weaknesses against potential security vulnerabilities. Tested apps come from VirusTotal's internal scanner. A nice big difference from VirusTotal's old release was that for all of the exploits, it wasn't just a "I executed one of these!", but rather "I executed one of these and was stopped by \_\_\_\_" or "I executed one of these and was stopped by \_\_\_\_" and I was able to determine which exploit was used because it generated a unique exit code per technique. As such, this release is pretty much a honey pot for exploit developers. I'm not sure why the installer is misleading. VirusTotal is a reasonably well-known company and I'd say most people already expect their testing platform to be built into the product.
