- Photoshop Elements now includes the best performance available in a consumer-level photo editor. Using an evolutionary path, Elements 20 builds on the work that Elements 15 introduced and is able to take advantage of the latest advances in CPU and GPU technology. For example, new antialiasing and filtering technologies are included, and most of the previous downsampling technologies are now optional.
- Elements also supports the latest web standards: HTML5 and HTML5 WebP. These technologies are well-supported by major browsers. In Elements 20, Elements supports Dynamic Web Libraries and Web Components.

For better startup speed and memory management, Adobe Elements uses a 64-bit architecture of Mac OS X. It also uses OpenGL 3.3 as the native graphics API, which is backwards compatible by using hardware-accelerated vertex shaders, providing higher-performance rendering. This also ensures graphics acceleration for the new layers in Elements 20. Elements 20 is also able to A-B compare images and quickly zoom in and out of layers.
