The default version of Photoshop Elements does not come with the standard “Back” and “Forward” buttons on the side. If you want to return to the previous image or get to the next image, you need to first select the destination image. For this reason, you will probably find yourself often switching between two images. Make sure you keep these two next to each other in your collection. Consider Not Switching When Editing You may want to edit an image before switching to another one in Photoshop Elements. If so, it is important to first set the copy tool on the previous image and save the edited version as a separate image. Here are the steps to follow: In Photoshop, set the copy tool and move the pasted image to the “New Image” window, or click the “Paste Options” icon. Save the edited version as a separate image. Click “File,” then “Save.” In the new window, select “Save for Web & Devices” and save the edited version as a JPEG file. Even if you want to only switch images without editing, it is important to remember to first set the copy tool. If you do not, you may face a problem when you want to return to the previous image. Here are the steps to follow: If you want to edit an image while leaving the previous image untouched, make sure to set the copy tool on the previous image. In the “Paste Options” box, select “Don’t Paste.” Click “File,” then “Save.” In the new window, select “Save for Web & Devices” and save the edited version as a JPEG file. Switch Images One at a Time or at a Time in the File List You may want to only edit one image. In this case, you can set the “Paste Options” box to “Paste as New Image.” But if you do this, it will not be easy to see which images are already edited in Elements. For this reason, you can try to switch the images one at a time, or you can switch the images at a time in the file list. The first technique can be useful when you want to remove a blemish or a defect on one image and want to keep the other images 05a79cecff

The index.php file must be loaded first in order for theme functionality to work, so if you want to execute code that is part of a plugin's wp_enqueue_scripts hook, you need to add it to the \$scripts array in the index.php file: global \$scripts; \$scripts[] = 'wp-load.php'; Also, if you are using any shortcodes (as they are mentioned in WP posts and pages), you need to include: require_once('shortcode.php'); in the wp_footer hook as well. The function that checks for errors in the index.php file is the following function: function debug_print_backtrace() { ob_start(); include_once(ABSPATH. '
