Ralink RT 3290 Wireless Lan Driver. TGF-beta1 and TGF-beta3 modulate p53 activation, cell cycle and apoptosis in a human tumor cell line, HT29. The transforming growth factor-beta (TGF-beta) family of proteins functions as a group of multifunctional growth regulatory molecules, originally identified in platelet-derived growth factors. They play important roles in embryogenesis and cancer, and may function as tumor suppressors. This study examined the effect of TGF-beta1 and TGF-beta3 on HT29 colon cancer cells. In contrast to the potent growth inhibitory effects of TGF-beta1 on other cell lines, TGF-beta1 failed to inhibit HT29 cell proliferation. However, TGF-beta3 was a potent growth suppressor. Cell cycle analysis demonstrated that TGF-beta3 increased the percentage of cells in the G2/M phase in a concentration-dependent manner, whereas TGF-beta1 had no effect. This increase was associated with the activation of p53, since it was abrogated by antisense oligonucleotides directed against p53 and overexpression of p53. In contrast to the G2/M block, TGF-beta3 reduced S-phase DNA synthesis, apparently by reducing the expression of cdc2. We observed that TGF-beta3 induced apoptosis, and that the caspase inhibitor z-DEVD-FMK completely blocked the effect. Conversely, TGF-beta1 had no effect on apoptosis or caspase activation, indicating that TGF-beta1 acts via an apoptosis-independent pathway. Thus, TGF-beta3 appears to be a more potent growth inhibitory factor in HT29 cells, and acts as a potent inducer of apoptosis. REVIEW: It's a funny thing about sequels. They're supposed to repeat the same story, only better. Well, that's a bit of an exaggeration, but not by much. The story of the Los Angeles County Sheriff's Department's continued hunt for the public enemy number one,
