What's New in the?

Windows 8.1 is a free upgrade to Windows 8. It includes the latest Windows 8 apps and features, but will look familiar to all previous Windows users. You can run all your Windows programs and enjoy the same experience as you had with Windows 7. Windows 8.1 is also the final version of Windows 8, so there is no support for Windows 8. Remove the Windows 8 apps and features that you don't need. Install Windows 8.1. Upgrade to Windows 8.1. Remove the apps that you don't need. I recommend the new approach to the debugging of applications. Its basis is the creation of a program with own module, special VPC library. It will get a considerable extension of Visual Studio; particularly in debugging. And only support! Now you have to learn how to customize Visual Studio and how to compile your code. In the beginning of the paragraph the author makes a factual error: There was a bug in the first version of Visual Studio, and not in Visual Studio 2010. Next the author tries to create something that is quite ridiculous and unique: A simple VPC library for Visual Studio 2010/2012 which would be installed into your Visual Studio 2012 in addition to the Visual Studio 2012. In fact there are a number of third-party tools/libraries for extension of Visual Studio 2013 to 2012. In addition, the author describes the need to install Visual Studio 2013 as a bug of the previous version. In my opinion this is again a nonsense. When a new version of the Windows SDK has been released, this update should be reflected in the Visual Studio installation too. And it is a pity, that the author does not offer an alternative to the development of applications with such defective libraries. Can the author not do that? This isn't the first time, when it is seen that somebody misses a good opportunity and is just showing off and trying to look like he is the best or the only one. There are many situations when one method of debugging is much better than another. In some cases, there is a need to generate and send out a certain number of the same sample file. It is better to do this automatically or via a script. Another situation is the need to gather a lot of data from the server. It is better to log data to a file or to the server via a script. I can think of a number of other situations. It
