multiple git tags in git repo? I have created a sample git repo and pushed it on a server. I created some tags like v1,v2,v3 for each tag I pushed it on the server. Now my question is what's the point of doing all this, is it considered as bad practice? Thanks. A: As a quick explanation, a tag is a commit that is associated with a (usually short) URL, so you can remember where it is with the git-blame command. You can also tag a range of commits: for example, git checkout v2.3.4..v2.4.1 will change your work-tree to have commits v2.3.4..v2.4.1 applied. The point of making tags is that you can easily create branches from the tags, so you can for example easily tag v1, and then create a branch to work on a bugfix that requires the modifications that were introduced in v1. If you're really working with remote repositories, you can even get rid of your local branch that's based on v1, and push to the remote branch that corresponds to it. 3 killed in bank robbery in Allegheny

County Three men were killed and three other people were injured when police say they robbed a bank near Monroeville. Author: Tegna Published: 11:47 PM EDT September 5, 2017 Updated: 11:47 PM EDT September 5, 2017 Three men were killed and three others were injured when police say they robbed a bank near Monroeville. Officers responded at 5:50 p.m. to the 100 block of Easton Ave. near Ross Park Mall after reports of an armed robbery at a Wells Fargo Bank. A suspect,

Thus a subfield of a field is a field that is a subgroup of a field extension (of degree at most two). Every extension of a field is contained in a finite Galois extension of that field (this is a special case of the fundamental theorem of Galois theory); since finite Galois extensions are algebraic extensions of fields (they are obtained by adjoining polynomials, in some algebraic closure), the field of fractions of a field is

contained in a finite Galois extension of the field. The converse is also true, since the field of fractions of a finite Galois extension of a field is algebraic (this is a consequence of Galois theory applied to the Galois group of the extension and the field of fractions of the field); hence the fraction field of every field is contained in a finite Galois extension of that field. The subfield generated by a set is the smallest field containing and closed under the laws of field formation. A field is a subfield of its algebraic closure, and is a Galois extension of. Another way to characterise a subfield
