(2) One difference is the appearance of the window itself. Lightroom 5 takes a bit of work to use from a familiar interface. Certainly, it's better than the "desktop" appearance of previous releases and should be more usable than an unfamiliar Windows application. A second issue is the increasing use of "light" in Lightroom's appearance. Lightroom's interface was always quite light, of course, but this is the first time I have noted its use has been even more prominent. The "preview" panel becomes light, so will your catalog along with it. The dialogue boxes (most often with image thumbnails) are light. Even the panel toolbar is lighter. You can use the "dark" theme to improve readability, but I noticed it blurs the final images I create, and I retain a preference for a lighter interface. Likewise, my Quick Look preview window rather than the "dark" one. Other changes include the addition of the "Manage Display Settings" tool. This is only available if you license the Creative Cloud program. There's an "Eye Dropper" that lets you create exciting color options on an image, with matching sliders for Hue, Saturation, etc. and a Preview button that shows illumination changes. The new tool to create and modify lens profiles is impressive. If you ever had read or heard of the terms profile, conversion profile, or profile editing, you'll love it. I was using Lightroom as a batch-processed tool for several years before I learned about it. Now it's easy to specify a lens profile or conversion image when you import negatives and slides. It also lets you adjust the priority of the profile. In nearly all cases, this is a great thing.)

Graphic design software in the early days was hard to use. Technology has come a long way, and software is now intuitive and helps a user express creativity more freely. Selecting the right platform

would depend on your work and what you want to achieve with the software. The Paint Bucket tool enables you to select a range of any solid color or path, and then applies that selection to the full canvas. This can be done without leaving the original canvas (like using a magic wand in Illustrator), and can be easily removed with the Brush tool. The Adjustment tool provides the ability to manually apply a filter, adjust levels or color balance, add shadows or saturate your image to lighten or darken the selected area. **What It Does:** The Gradient tool lets you create a nice, faded background effect of the color you choose. It's perfect for solid backgrounds or for custom coloring large areas. The Gradient tool even lets you apply a gradient to a gradient, so you can color an image from background to edges, for example. The Spill and Spot healing tools lets you select an area and add color into it with the currently active color. This is useful for filling in empty areas of an image and desaturating areas of a photo—especially around a person's eyes. It's also great for removing common objects like scratches and coffee cups from photos.
