Sharpen (SRF): Speaking of shrinking the image size... well, the thing is that every digital image from a camera is stored as a bitmap, which means it's made up of points of light and dark. Each pixel is a bit, a single value that can be 0 or 1, 1 being dark and 0 being light. It's in this format that files are stored on your hard drive, either as 8-bit grayscale or 16-bit pixels, with millions of shades of grayscale. In Photoshop's latest update -- for both folks using the Creative Cloud version and those who purchase it for a one-off fee -- our favorite imaging tool now supports new features like smart guides, sidebar artboards and the dodge and burn tools. This feature is actually better than it sounds. The new system allows for artboards to be created, named and isolated to keep assets separate and organize your photos much better. They will keep the original aspect ratio of your images, so you can crop images to fit quick and easily on your iPad Pro screen. You can also switch from drawing on the Artboards side panel to the main Photoshop window, or vice versa, switching modes with the press of a finger. The iOS and macOS apps features a new Eyedropper tool that lets you select color-fill tones from your artboards. It's a nifty little tool that solves the age-old problem of having to spend time trying to find the right color in your image editor. Finally, there is a new preview panel, a convenient way to zoom in to your desired quality level along with a feature that allows the user to choose where the map shows. This update is a welcome addition for those who like to use their iPads and Apple Pencil with Creatives Cloud in the field.
