Editing photos in Photoshop is, for most of the users, one of the most important features. The software is giving a much-needed boost to the editing features which were initially slow in comparison with other similar tools. Though the editing has gone slow, however, now it has caught up and becomes one of the most used tools among graphic designers. With this transition of technology, designers and developers are switching to Photoshop, considering it as the most stable and creative platform to work on. Photoshop might not have the features it had a while ago, but it still holds a lot of value in deciding the major success of an image editing tool. The best part about this transition is that, it has offered updated versions of the software, giving you more tools and a better experience as compared to before this update. Photoshop now offers hundreds of ways to share and work on images. The new Share for Review (beta) feature creates a new collaborative space within Photoshop, enabling users to browse, tag, comment, and hand off projects to one another. As an added bonus, with Share for Review, projects that are published to the cloud are instantly back-dated to be visible to fellow collaborators on various devices. When the user downloads the shared project, the original project resumes from where it was left off. With collaboration turned on for the first time, Photoshop Elements users working inside Photoshop on a new device will simply need to download the previously shared project to their new device, and continue editing.
