Photoshop's increased flexibility in manipulating layers and its ability to correct perspective on 2D and 3D images makes it an ideal companion to powerful content-aware tools such as Content-Aware Move, Content-Aware Fill, and Content-Aware Smart Blur. Photoshop has a feature most Elements users will require the most out of: the ability to insert multiple layers into an image. While Elements allows you to create a new layer from any object in an image, it is not nearly as versatile as doing so in Photoshop. For instance, one cannot insert a new layer and change the color, opacity, or simple shape of the layer any more than you can in Adobe Photoshop. Adobe Photoshop's most powerful feature is its content-aware full-color replacement tool, Content-Aware Move. This tool, particularly since the introduction and expansion of its sophisticated replacement toolset, has become the premier image editing tool for removing content. A common requirement for web designers is to correctly select pieces of content or objects from an image, and replace and remove them with a single action. Selecting objects is typically done using select tools, either generic tools that perform the same action on all objects, or non-select tools like lasso or poly-select that select objects based on customizable parameters. However, as web designers often work remotely and use browser-based apps to edit images, it is not always easy to use select tools to correctly select and perform the desired action on the right objects. While working with content in the browser, the Pick up Part feature enables Photoshop to accurately and consistently select and move and resize specific parts of objects or groups of objects. For example, when selecting an object you can press S to pick up the object. To place the object, just move the mouse to a predefined position and a crosshair will appear, and with a click it will be placed.
