Secure Autologon is not a VPN and is not like other similar utilities. It is not a software that you install on your system, it does not intercept your network traffic, and it does not require you to connect to an external server. Its functionality is based on a feature called Autologon, which automatically logs you into Windows without requiring you to enter a password. As such, you do not have to worry about forgetting to log out of your current session before powering off your PC or disconnecting from the internet. The program is designed to help you maximize your computing experience by allowing you to conveniently log onto your Windows without having to enter a password each time you turn on your PC. It is a portable software that can be installed on most versions of Windows, irrespective of whether it's 32 or 64 bits. Once set up, the program will monitor your network, and trigger the login and logout process automatically when a computer becomes connected to it. The administrator login and logout screen will appear after a predetermined period of time with no user interaction required. The software is a simple and lightweight application that does not require a smart user to configure. However, it does not act as a VPN and is not meant to provide remote access to your system. On the contrary, it only works with the built-in Windows autologon feature. Virtual WiFi Router allows you to remotely view the administration console of the appliance and manage it via a web browser. Although Secure Autologon is extremely easy to configure and doesn't require a user to do anything other than add a few lines in the registry, it is recommended to only use it with a highly-secured Wi-Fi network, in which all PCs are protected by a security solution such as a firewall and/or virus scanner. Secure Autologon is a popular command line application designed to help you configure a seamless logon in your system with the Autologon feature.
