Information theory is a branch of mathematics that deals with the transmission and processing of messages (i.e., information) on communication channels (i.e., media). Information theory plays an important role in mathematics, computer science, and engineering. The theory is at the interface between information and communication, and provides such definitions as entropy, mutual information, information rate, and the capacity of a channel. In this tutorial, we will discuss a very important concept from information theory, coding. Coding theory is a branch of applied mathematics that covers the design of error correcting and error reducing encoding and decoding algorithms, and the application of these algorithms to communications and information theory. Coding theory is an important tool in the design of digital communication systems, especially in the design of error-correcting codes. Coding theory is mostly used in information theory for error control as well as source coding, in which we wish to minimize the probability of error in the transmission of messages through noisy channels. error control coding e.g. high fidelity reproduction of sound The resource should be authorized, to place it in your shopping cart, please visit the resource, make payments, you will then be able to download file(s).
